2022 OMS-MISO Survey Results

Furthering our joint commitment to regional resource adequacy, OMS and MISO are pleased to announce the results of the 2022 OMS-MISO Survey

June 10, 2022

Projections and data do not account for impacts of recent and future tariff filings, including those related to Resource Availability & Need
Given the capacity outlook for 2023 and beyond, efforts must be accelerated and reinforced to reliably manage the portfolio transition

- MISO is projected to have a capacity deficit of 2.6 GW below the 2023 PRMR. Depending on market responses to the 2022 PRA, projected capacity surplus could be as much as 2.4 GW

- Similar to the 2022 PRA results, the capacity deficit is restricted to MISO North/Central, partially offset by exports from the South region

- Capacity deficits are projected to widen in subsequent years, consistent with past surveys

- Demand growth is projected to continue post-Covid recovery in 2023 at +1 GW (+0.8% compared to 2022 PRA), but modest growth thereafter at 0.2% per year

**Implications:** To ensure reliable operations, MISO will be increasingly reliant on emergency or non-firm resources, such as imports, which are not reflected in the survey but have historically been important and available to MISO
MISO Resource Adequacy Requirements

- Load serving entities within each zone must have sufficient resources to meet load and required reserves.
- Surplus resources may be shared among load serving entities with resource deficits to meet reserve requirements.

The survey uses three categories to help characterize relative levels of resource certainty

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Committed Capacity</td>
<td>Consists of installed generation resources and projects with interconnection agreements with commercial operation dates expected during survey year</td>
</tr>
<tr>
<td></td>
<td>This report assumes that these resources will be used to meet the PRMR</td>
</tr>
<tr>
<td>Potentially Unavailable Resources</td>
<td>Consists of installed generation resources whose commitment to MISO is unclear</td>
</tr>
<tr>
<td></td>
<td>This report assumes that these resources will NOT be used to meet the PRMR</td>
</tr>
<tr>
<td>Potential New Capacity (Alternative Method)</td>
<td>Consists of projects in MISO’s generation interconnection queue with capacity weighted consistent with past years*</td>
</tr>
<tr>
<td></td>
<td>Alternative method - Historically MISO has seen 2-3 GW of new capacity energized annually (assumes average of 2.5 GW/year)</td>
</tr>
</tbody>
</table>

* Descriptions of Resource Categories and Queue Treatment on slides 14 - 16 in appendix
Capacity mentioned is Unforced Capacity (UCAP).
Committed capacity projections show deficit increasing over survey period. Depending on the pace of resource retirements and new capacity additions, risk can be meaningfully mitigated.

2022 OMS Survey UCAP (GW) - Overall MISO Footprint

<table>
<thead>

</tr>
</tbody>
</table>

Bracketed values indicate difference between Committed Capacity and projected PRMR.

Legend:
- Committed Capacity
- Potentially Unavailable Resources
- Potential New Capacity
- PRMR

Note: Potential New Capacity projected per methodology consistent with past years.

RDT limit of 1900 MW is reflected in this chart.
Alternative method based on historical installations of 2.5 GW/year would indicate reduced ‘potential new capacity’

Bracketed values indicate difference between Committed Capacity and projected PRMR

Legend
- Committed Capacity
- PotentiallyUnavailable Resources
- Potential New Capacity (Alternative Method)*
- PRMR

*Alternative method reflects historical rate of actual capacity additions in MISO
Note: RDT limit of 1900 MW is reflected in this chart
External factors can impact projected deficits or surpluses

**Downside Risks**

- Accelerated retirements
- Reduction in projected capacity additions
- Bulk of new resources are at lower capacity accreditations
- Delays due to solar tariff investigations & supply chain bottlenecks
- Higher load growth due to electrification

**Upside Possibilities**

- Lower than expected load growth
- Potential additional capacity in response to 2022 PRA outcomes
  - Return to service of suspended resources and deferred retirements
  - Additional External Resources
  - Additional LMR registrations
- Leveraging recent queue improvements
Comparison of year-over-year survey results for 2023 indicates a reduction of committed capacity with higher load growth

2023 Regional Outlook
Reconciliation between 2021 & 2022 OMS MISO Survey for 2023

New resources include resources with newly signed Interconnection Agreements; wind at ELCC, solar at 50%
Increased availability results from potential resources from 2021 survey that are now committed resources
LMRs – Load Modifying Resources are Demand Response (DR) and Behind the Meter Generation (BTMG)
Across the five-year outlook, projected Committed Capacity has decreased in 2022 as compared to the 2021 survey.
Capacity shortages shown in 2022 PRA are reflected in the 2023 survey zonal outlook
By 2027, North/Central will need completion of significant number of MISO GI projects to cover projected Committed Capacity deficit.
New generation and load modifying resources continue to be important in meeting local resource needs

- **UCAP MW**

**2022 OMS MISO Survey PY 2023/24 By Zone vs. LCR**

**2022 OMS MISO Survey PY 2027/28 By Zone vs. LCR**

- Includes only projected capacity resources within the zone, i.e. does not include imports and interzonal transfers
- Potential Capacity includes both new generation and potential retirements
- Load Modifying Resources include Demand Response (DR) and Behind the Meter Generation (BTMG)
Understanding Resource Categories

- **Committed Capacity** - resources committed to serving MISO load
  - Resources within MISO utilities’ rate base
  - New generators with signed interconnection agreements
  - External resources with firm contracts to MISO load
  - Non-rate base units without announced retirements or commitments to non-MISO load

- **Potentially Unavailable Resources** - resources that may be available to serve MISO load but may not have firm commitments to do so
  - Indicated as Low Certainty in survey results by Market Participants
  - Includes potential retirements or suspensions

- **Potential New Capacity** - UCAP for new resource projects in the MISO Generator Interconnection Queue accredited at the current (2022) new resource capacity credit levels and adjusted for projected queue certainty factors

- **Unavailable resources** are not included in the survey totals
  - Resources with firm commitments to non-MISO load
  - Resources with finalized retirements or suspensions
  - Potential new generation which are not currently in the MISO Generator Interconnection Queue
Potential New Capacity represents capacity in the MISO Generator Interconnection Queue at projected queue certainty factors as of April 28, 2022. Wind and solar resource UCAP values are accounted for at current new resource capacity credit values (15.5% ELCC for Wind, 50% for solar).

Future resource ranges will shift as planned generation interconnections are firmed up.

**“Potential capacity” values shown here are higher than amounts shown on slide 4 because they do not factor in RDT limitations.**
2022 OMS-MISO Survey Queue Treatment

Apply Capacity Credit
- Wind 15.5%
- Solar 50%
- All other 100%

Apply DPP Study Phase Weighting
- Not Started and Phase 1 = 10%
- Phase 2 = 75% Non-Intermittent, 50% Intermittent
- GIA in Progress and Phase 3 = 90%

Requested In-Service Date
- If requested in-service date is prior to the first Survey year, projects moved to their DPP study cycle end date, unless an updated date provided in the OMS-MISO Survey

DPP Study Cycle Not Started
- If DPP Study Cycle not started, the requested in-service dates are moved to the DPP study cycle end date plus 2 years unless updated date provided in the OMS-MISO Survey

- DPP Study Phase Weighting is applied to recognize that as projects move through the queue process, the likelihood of completion generally becomes more certain.
- In-service date adjusted if the DPP Study Cycle phase is “Not Started” to recognize that a project likely can’t get capacity credit until at least the end of the DPP study cycle and an additional 2 years to reflect expected GIA dates and construction timelines.
Similar to the 2022 PRA results, North/Central is projected to have a shortage while the South sub-region has a surplus.

While RDT is not reflected in these charts the limit is currently 1900 MW in Resource Adequacy.
Projected Capacity GW → Committed Capacity has decreased as compared to 2021 survey across the five-year outlook.

**Legend**
- Committed Capacity
- Potentially Unavailable Resources
- Potential New Capacity
- PRMR

Bracketed values indicate difference between Committed Capacity and projected PRMR.
Forecasted resource mix continues to show increasing reliance on gas and renewables

- Wind and solar resources shown at current new resource capacity credit accreditation (15.5% ELCC for Wind, 50% for solar)
- Hybrid resources combined in solar category in OMS survey ~2.5GW in 2027
